

## How Vulnerable is Your Online Banking Website to Fraud?

It's a known fact that the internet is a hotbed for malware and phishing attacks. So when your customers bank with you online, they become prime targets for such attacks and so do you. Fraudsters are coming up with sophisticated techniques to hijack your customers' account credentials and commit fraud against you everyday, making it tough to keep up. Zero day attacks further complicate the issue. Strong authentication techniques are no longer enough as criminals have already found ways to break through them. What can you do to protect assets and prevent online fraud?

### Trusteer Rapport - Trusted by More than 60 Banks and 6 Million Customers

Rapport is a lightweight security solution that prevents sensitive data, such as account credentials, from being stolen from customer computers. By locking down customer browsers and creating a tunnel for safe communication with your online banking website, Rapport prevents Man-in-the-Browser (malware) and Man-in-the-Middle attacks that aim to gain unauthorized access to web pages and sensitive information flowing through it. Phishing is also prevented via website authentication to ensure that customer account credentials are passed to genuine sources only. Rapport blocks advanced Trojans including Zeus, Sylon, Torpig and Yaludle, and comes with a rapid update mechanism that allows it to immediately take action against changes in threat and malware behavior.

Rapport can be deployed in days and comes with a proprietary management application that enables you to effectively trigger alerts, view and analyze data as well as manage security. Downloadable by your customers in seconds, Rapport is desktop software that works in the background and doesn't call for a change in user behavior – your customers can bank and use the internet as usual – thus enabling fast adoption.

Rapport differs from Anti-Virus and Firewalls because it:

1. Locks down access to financial and private data instead of looking for malware signatures
2. Communicates with your online banking website to provide feedback on security level and report unauthorized access attempts
3. Enables you to take immediate action against changes in threat

### Features:

- Blocks Zeus, Torpig, Silent Banker and other Man-in-the-Browser attacks
- Blocks all malware attacks including Keyloggers and Pharming
- Enables phishing site detection and confirmation
- Delivers advanced reporting on current and new threats including zero-day attacks
- Comes with pre-packaged marketing tools and materials
- 24x7 support option

### Benefits:

- Prevention of wire and ACH fraud
- Deployment within weeks, no IT integration required
- Fast notification of threats affecting your customers
- Fast adoption by your customers using proven tools
- Added security with no change in user behavior
- Proactive rather than reactive to threats and incidents
