

Is Mobile Device Access Strengthening Your Enterprise or Undermining Data Security?

IT departments are under pressure from the executive suite all the way to the departmental level to allow employee-owned tablets and mobile devices to connect to secure enterprise web resources. While this might be great for productivity, it can seriously undermine the security of sensitive corporate data. Tablets and mobile devices – including the iPad, iPhone, and Android - are just as vulnerable to malware attacks as PCs since they also have exploitable flaws that malware can abuse. What's more, recent research reports indicate that criminals will escalate attacks on fragile mobile infrastructure. Opening the door to potentially infected devices could expose confidential business data to criminals. Can enterprises really run the risk of trusting every mobile device that attempts to access their network?

Secure Web Access from Mobile Devices

Trusteer Secure Web Access for tablets and mobile phones protects confidential corporate data by allowing access to malware-free, properly secured devices only. It enables control of connections to enterprise and cloud based web resources based on the security status of the device.

When access to enterprise web resources is requested, Trusteer Secure Web Access evaluates the device for the presence of malware or vulnerabilities. It permits a connection only if the device is found to be malware free and without vulnerabilities. Tablets and mobile phones not employing Secure Web Access are barred from network access and are asked to download it, keeping potential threats out of enterprise web resources.

What's more, enterprises can get real time events of infected or vulnerable devices attempting access to web resources. This enables proactive action to mitigate potential threats.

Trusteer's is the only mobile and tablet security solution that can be deployed within hours and without any need for dedicated software or hardware in the data center.

Once deployed, the solution requires zero employee training. Its easy to use interface and instant on boarding process allow employees to immediately enjoy secure access to selected web resources from all major tablets and mobile devices.

Trusteer's solution is based on award winning technology used by more than 100 leading banks around the world to protect critical online banking applications being accessed from potentially insecure customer endpoints.

Features:

- Enables access only to malware and vulnerability free devices
- Provides immediate alerts on insecure devices trying to connect to enterprise web resources
- Protects browser content and log-in credentials from being captured by malware and phishing
- Cloud-based management
- Instant integration with any web application or access gateway
- Supports all major tablets and mobile devices
- 24x7 support option

Benefits:

- Allow employees to securely connect from any tablet or mobile device
- Keep infected and insecure devices away from your network and web applications
- Identify and react to tablets and mobiles devices at risk
- Ensure confidentiality of log-in credentials and corporate data when accessed from mobile devices
- Fast and easy deployment
- Easy to use interface requiring no employee training
